SCHEDULE – II**1. Eligibility Criteria: -**

1.1 Essential qualification:-

- a. Experience of at least two works of one year each in operation & maintenance of PLC and steam based liquid waste sterilization plant of minimum processing volume of 10 m³ liquid per day during last 5 years in Govt/PSU/Autonomous bodies/Local Govt./Reputed process industries.
- b. Scanned copy of satisfactory past performance certificate from the clients as specified above (1.1a).

2. Process Description: -

- 2.1 All the contaminated water coming from the containment laboratory and animal wings collected in the basement is to be steam sterilized before release to outside. Per 24 hours, an estimated volume of about 20 M³ will have to be treated. Each wing is provided with a storage tank for sewage water with a volume of about 15 M³ each. The tanks serve as collecting and storing effluent for a short period. Final sterilization is done in batch sterilizers. Apart from the storage/ collecting tanks in the basement of each wing, the installation has two mixing tanks, which temporarily can serve as extra storage capacity in case of emergency. To reduce the risk of total breakdown, all critical components are double and can take care of the total capacity.
- 2.2 Under natural flow the sewage water is transported to one of the main storage tanks located under each wing. Each tank is provided with two transporting pumps, controlled by level controls in each tank, for transferring the sewage water to the mixing tanks in the sewage treatment unit. The sewage is mixed in the mixing tank before being discharged to the batch sterilizers. For the transport to the six batch sterilizers, monopumps are used in combination with a blender device (for cutting of longer particles/straw/fibres etc.) to protect pumps and valves.
- 2.3 After the mixing and preheating in the mixing tank, the effluent is automatically pumped to batch sterilizers, where after being filled to the maximum level; a sterilization process starts automatically and sterilizes the contents of the batch sterilizer at 121⁰C for 30 min. This takes about 90 minutes, followed by a final check before being discharged to a lagoon outside the building. As mentioned already, the discharged material has to pass a serpentine in the mixing tanks to cool down to a safe temperature for discharging and for saving energy by heating up the contents of the mixing tank, still to be sterilized.
- 2.4 The calculated temperature of the sterilized effluent, and after having passed this serpentine, will be about 70⁰C.

3. Scope of Work:-

- 3.1 **Sterilization:-** The contaminated water from the containment laboratory and animal wing is to be sterilized at 121⁰C for 30 minutes before releasing to outside. The minimum of 15-20 M³ will have to be sterilized daily. In case the effluent is more, then the system to be run till the effluent is exhausted. If the need arises then even the

systems is to be run on Sunday/holidays/National Holidays. The work also involves the maintenance/repairs of the Plant/Instruments/PLC/Piping (SS/HDPE/MS) tanks/Pumps/ Marcerators/ Control valves etc. Pipe includes compete piping in the liquid waste sterilization plant coming from the ceiling of ground /1st floor.
